LUMIÈRE
BEAUTY CO.

Digital Marketing Analyst Case Study

Post-campaign performance analysis & strategic recommendations for a D2C beauty brand's multi-channel Diwali 2025 festive activation.

Advertiser	Lumière Beauty Co. (D2C Premium Skincare, India)
Campaign	Diwali 2025 Festive Sale
Flight	October 15 – November 15, 2025 (32 days)
Total Budget	₹50,00,000 (~USD 60,000)
Channels Activated	Meta Ads • Google Search • YouTube • Influencer Marketing
Deliverable	Performance deck (10–14 slides) + recommendations
Your Role	Digital Marketing Analyst — Measurement & Insights Team

Prepared as a training brief — mirrors the structure of real marketing analyst case studies used by Uber Advertising, Amazon Ads, Meta, Swiggy, and CPG measurement teams. Data is synthetic but structurally authentic. All figures in Indian Rupees (₹) unless stated.

Objective

Your task is to **review the media plan**, analyze campaign and platform-level data for Lumière Beauty Co., and **prepare a presentation for the client** outlining overall campaign performance, sales impact, and strategic recommendations for the next festive window.

You are the measurement analyst on this account. The Account Director has asked you to own the full post-mortem and present findings to the client's Head of Growth & CMO. The deck should be **insight-led, not data-dump-led** — every chart should answer a question a busy marketing leader would actually ask.

Materials Provided

1. **Campaign Media Plan** — Flight dates, placements, targeting, rate types and budget for each channel.
2. **Meta Ads (Facebook + Instagram) campaign data** — Daily performance by campaign, placement and strategy.
3. **Google Search Ads data** — City × keyword-group × device daily performance.
4. **YouTube Ads data** — Daily performance by ad format.
5. **Influencer Marketing data** — Creator-level deliverables, engagement, code redemptions and fees.
6. **Platform sales data** — Daily D2C + marketplace sales (pre-campaign and campaign periods) by SKU and channel.
7. **Benchmarks appendix** — Internal benchmarks for each ad surface from the previous two quarters.

❖ How to use the data

The campaign data files are **intentionally raw and messy** — exactly as they would arrive from an ad-server export or warehouse pull. You will encounter null values, '\N' placeholders, inconsistent city spellings, and some over-budget overshoots. Cleaning, validating and reconciling the data **is part of the job**. Document every assumption you make.

Business Context · Why This Campaign Matters

Lumière Beauty Co. is a 3-year-old D2C premium skincare brand, best known for its Vitamin C Radiance Serum and its clean, minimalist packaging. The brand sells on its own website (lumierebeauty.com) and via Amazon India, Nykaa and Myntra. ARR is ~₹28 Cr, with roughly 60% of revenue coming from women aged 24–38 in Tier-1 Indian cities.

Festive quarters (particularly **Diwali**) typically deliver 35–45% of the brand's annual revenue. In previous years, Lumière relied almost exclusively on Meta Ads and a handful of mega-influencers. For Diwali 2025, the CMO has asked the team to pilot a **multi-channel, full-funnel activation** with a total budget of **₹50 lakhs** spread across four channels. A new hero SKU — the Diwali Glow Gift Set at ₹2,499 — launched alongside the campaign.

Client's Stated Goals for Diwali 2025

① Grow daily Uber-Eats... sorry — *platform* revenue by **at least 2.5×** vs the pre-campaign baseline. ② Acquire **new customers** (not just repeat). ③ Test whether a **diversified channel mix** outperforms a Meta-heavy strategy. ④ Generate a repeatable **measurement playbook** for future festive activations.

Your Four Client Stakeholders

Role	Primary Concern	What They'll Ask
CMO, Lumière	Was the bet on a diversified channel mix worth it?	"Should I keep the ₹50 lakh budget at this level or increase it next year?"
Head of Growth	Which channel should I lean into vs retire?	"If I had to cut one channel tomorrow, which one and why?"
Brand Manager	Did we acquire the right kind of customer?	"What's the new-vs-repeat mix — and did we expand the top-of-funnel?"
Finance Partner	What's the efficiency story per rupee spent?	"Give me ROAS by channel and the incremental sales lift number."

The Analysis · What Your Deck Must Address

Your deck must address **three layered questions**. Each one builds on the previous. Do not skip straight to recommendations — the client needs to see the data journey.

▶ 1. Channel-Level Performance vs Benchmark

For each of the four ad surfaces, summarize performance and evaluate against its own benchmark (see Appendix). Do **not** compare Meta CTR to Google Search CTR — they serve different funnel stages and have structurally different benchmarks.

a. **Meta Ads** (Facebook + Instagram): How did CTR, CVR and ROAS perform vs benchmark? Which placement drove the strongest results — Feed, Stories or Reels? Did Prospecting or Retargeting perform better?

b. **Google Search Ads**: CTR, CVR, ROAS vs benchmark. Which keyword groups were most efficient? Any insights by city or device?

c. **YouTube Ads**: Which ad format (Skippable / Non-Skippable / Shorts / Masthead) drove the best view-through rate? Did the weak CTR necessarily mean weak performance?

d. **Influencer Marketing**: How did the three tiers (Nano / Micro / Macro) compare on *engagement rate*, *code redemption rate* and *blended ROAS*? Who were your top 3 and bottom 3 creators?

▶ 2. Platform Sales Impact · Did the Campaign Actually Move the Needle?

Ad platforms report attributed conversions — but the real question for the CMO is whether **total platform sales** grew. Compare the pre-campaign period (15 Sep – 14 Oct) against the campaign period (15 Oct – 15 Nov).

a. **Daily sales:** Did *daily* (not total) revenue increase? By how much? Don't just compare period totals — the two periods have different day counts.

b. **Average Order Value (AOV):** Did AOV change? If yes, what's driving it — the new Diwali Gift Set, or changes in purchase behavior?

c. **New vs Repeat customers:** Did the campaign bring in new buyers, or just harvest existing ones? Which channel drove the biggest new-customer influx?

d. **SKU and sales-channel mix:** Which SKUs outperformed? Did D2C website gain share vs marketplaces (Amazon / Nykaa / Myntra)?

The Analysis · continued

▶ 3. Recommendations for the Next Campaign

This is where you earn your fee. The client is already planning Holi 2026 (₹40 lakh budget) and asking whether to copy-paste the Diwali playbook. Your job is to tell them what to keep, what to change, and what to test.

a. **What should Brand X do differently next time?** Where was there clear underperformance or inefficient spend? Any budget reallocation you'd recommend?

b. **What should Brand X do the same next time?** What worked — and should be doubled down on?

c. **Measurement recommendations:** What additional data / tests / experiments would you want set up *before* the next campaign to make the next post-mortem richer? (Hint: think incrementality, UTM hygiene, geo holdout, etc.)

★ A senior consultant's tip

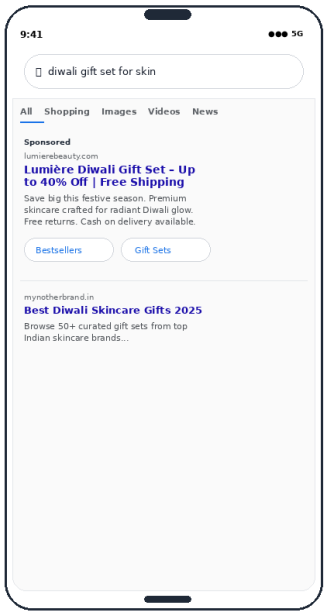

Weak analysts describe what happened ("ROAS was 4.2x"). Good analysts explain why it happened ("ROAS was 4.2x because Google Search intent users skewed toward the high-AOV Gift Set"). **Great analysts say what the client should do about it** ("Shift ₹6 lakhs from Meta Prospecting to Google Branded + Gift Set keywords — expected uplift of ₹14 lakhs incremental revenue, based on the observed ROAS differential"). Aim for great.

Ad Surface Reference · What These Placements Look Like

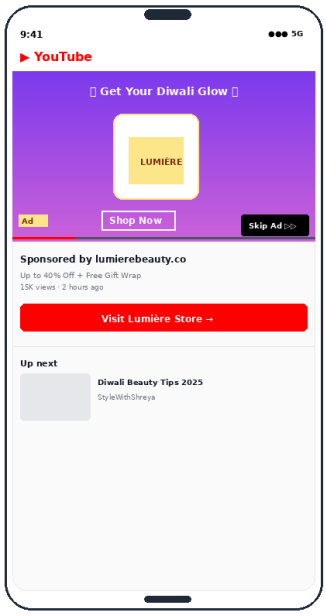

Below is a visual reference for each of the four ad surfaces in this campaign. Each ad surface sits at a different funnel stage and should be evaluated against **its own benchmark**.

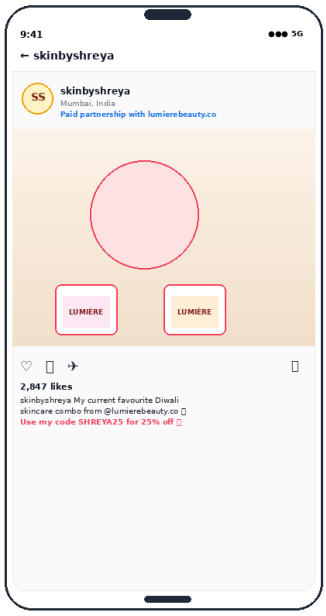

Meta Ads (FB + IG)
Upper/Mid-funnel · Awareness + Consideration

Google Search Ads
Lower-funnel · High-intent Conversion

YouTube Ads
Upper-funnel · Awareness + Consideration

Influencer Marketing
Mid/Lower-funnel · Trust + Conversion

Metrics Required by Ad Surface

Every ad surface has a different job. The metrics below are the **minimum** you must report per channel — but feel free to go deeper where interesting.

■ Meta Ads (Facebook + Instagram)

Metric	Formula / Definition	Why It Matters
Impressions	Count of times ad was served	Top-of-funnel reach indicator
Reach (Unique Users)	Distinct users exposed	True audience size
Frequency	Impressions / Reach	Overexposure signal (>3–4 = fatigue)
Link Clicks	Clicks that open the destination URL	Intent signal
CTR (Link)	Link Clicks / Impressions	Creative quality + relevance
Spend (₹)	CPM × (Impressions / 1000)	Media cost
Conversions (Purchases)	Attributed purchases	Direct business outcome
Conversion Value (₹)	Revenue attributed to Meta	Top-line impact
ROAS	Conversion Value / Spend	Return on ad spend

■ Google Search Ads

Metric	Formula / Definition	Why It Matters
Impressions	Times ad appeared in search results	Query volume demand
Clicks	Paid clicks on your ad	High-intent visitors
CTR	Clicks / Impressions	Ad relevance + rank
Avg CPC (₹)	Spend / Clicks	Keyword competitiveness
Conversions	Attributed purchases	Direct outcome
Conversion Rate (CVR)	Conversions / Clicks	Landing page + offer quality
Spend (₹)	Sum of click × CPC	Media cost
ROAS	Conversion Value / Spend	Efficiency of search spend

Metrics · continued

■ YouTube Ads

Metric	Formula / Definition	Why It Matters
Impressions	Ad served count	Reach
Paid Views	Views ≥ 30s (or full for bumpers)	Meaningful exposure
View-Through Rate (VTR)	Paid Views / Impressions	Creative hook strength
CTR	Clicks / Impressions	Intent signal (low for video — normal)
Video Completions	Watched full length	Brand recall proxy
Avg CPV (₹)	Spend / Paid Views	Cost per meaningful view
Post-Click Conversions	Direct conversions	Usually small — video assists rather than converts

■ Influencer Marketing

Metric	Formula / Definition	Why It Matters
Reach	Unique users who saw the post	Audience size
Engagement Rate	(Likes + Comments + Shares + Saves) / Reach	Audience quality
Clicks to Site	Link taps from story/bio	Traffic driven
Code Redemptions	Unique promo-code uses	Purely attributable conversions
Revenue Generated (₹)	Redemptions × AOV	Top-line impact
Total Creator Cost	Flat fee + Commission	All-in spend
Blended ROAS	Revenue / Total Creator Cost	Creator efficiency

The Marketing Funnel — Why Different Metrics for Different Channels?

Channels sit at different funnel stages, so judging them on the same KPI is a rookie mistake. A YouTube video ad with 0.3% CTR isn't "failing" — CTR isn't even its primary job. Its job is to build awareness that shows up later as branded search or direct site visits.

Funnel Stage	Primary Channels (This Campaign)	Primary KPI	Secondary KPI
Awareness (Top)	YouTube, Meta Prospecting	Reach, VTR	CTR, Brand Lift
Consideration (Mid)	Meta Retargeting, Influencer Macro	CTR, Engagement Rate	Add-to-Cart
Conversion (Lower)	Google Search, Influencer Micro/Nano	CVR, ROAS	New-customer rate
Retention (Post)	Email/SMS, CRM (out of scope here)	Repeat Rate, LTV	NPS

Benchmarks Appendix

These are the internal benchmarks used by the measurement team to evaluate campaign performance. Source: *blended averages across D2C beauty advertisers in India, Q2–Q3 FY2025*. When comparing your campaign's numbers, always compare within-channel (Meta CTR vs Meta CTR benchmark — not Meta CTR vs Google CTR benchmark).

Channel	Metric	Benchmark	Direction
Meta Ads (FB + IG)	CTR (Link)	1.20%	↑ Higher is better
Meta Ads (FB + IG)	Conversion Rate	2.00%	↑ Higher is better
Meta Ads (FB + IG)	ROAS	3.00x	↑ Higher is better
Meta Ads (FB + IG)	CPM	₹180	↓ Lower is better
Google Search	CTR	3.50%	↑ Higher is better
Google Search	Conversion Rate	4.50%	↑ Higher is better
Google Search	ROAS	5.00x	↑ Higher is better
Google Search	Avg CPC	₹25	↓ Lower is better
YouTube	View-Through Rate (VTR)	25.0%	↑ Higher is better
YouTube	CTR	0.40%	↑ Higher is better
YouTube	Avg CPV	₹1.50	↓ Lower is better
Influencer	Engagement Rate	3.00%	↑ Higher is better
Influencer	Code Redemption Rate	0.45%	↑ Higher is better
Influencer	Blended ROAS	2.50x	↑ Higher is better

▲ Benchmarks ≠ Targets

A benchmark is a *reference*, not a bar you must clear. Context matters: a 2.8x ROAS on a Prospecting campaign (where the job is to find *new* customers, not re-target existing ones) can be a healthy outcome even if it falls under the 3.0x benchmark — especially if new-customer rate is high. Always interpret benchmarks alongside funnel stage and strategic intent.

Tips From Your Senior Analyst · Read Before You Start

◆ Framework to follow

Use this five-step loop for **every** channel before you write a single slide:

Step 1 — **Clean**	Drop or impute \N / null rows. Normalize city names. Parse dates. Confirm spend ties to the media plan (watch out for overshoots).
Step 2 — **Aggregate**	Build a channel-level summary table: Imp / Clicks / CTR / Conversions / CVR / Spend / Revenue / ROAS.
Step 3 — **Benchmark**	Compare each metric vs its own benchmark. Flag green (above) / red (below) / amber (within 10%).
Step 4 — **Diagnose**	Drill down — by placement, keyword, creator, SKU, city — to explain *why* a metric moved.
Step 5 — **Recommend**	Translate each diagnosis into one concrete, quantified action for the next campaign.

★ Hints hiding in the data

- The **new Diwali Gift Set (SKU LUM-GS-001)** only appears in the campaign period. Don't let it inflate your AOV comparison unfairly — consider analyzing AOV both *including* and *excluding* this SKU.
- **Influencer ROAS by tier tells a counter-intuitive story.** Resist the "more followers = more revenue" instinct and actually calculate ROAS per tier.
- The **Google Search CVR varies massively by keyword group.** A Brand search converts very differently from a Competitor search. Roll up a weighted comparison, not a simple average.
- **City-name variations** (Bangalore / Bengaluru / Bombay / MUMBAI) will break naive GROUP BY operations. Standardize before aggregating.
- **Some channels overshot their budget.** That's realistic — bid-based auctions can overdeliver. Call this out in your recommendations, don't hide it.
- The **weekend effect** is real. Daily comparisons need day-of-week controls.

◆ Visualization principles

Use visualizations liberally — the client will *look at* your deck, not read it. Some rules: (1) Never show a chart without a one-line takeaway title, e.g. not "*CTR by placement*" but "*Stories beat Feed on CTR by 32% — consider shifting budget*". (2) Keep charts to **one message per chart**. If you're tempted to stack three lines on one axis, make it three charts. (3) **Always label the benchmark** as a reference line. (4) Favor bar/line charts over pies — humans read length better than area.

Final Deliverable · What to Submit

Submit a **10 – 14 slide presentation (PDF or PowerPoint)** structured as below. Optionally include your analysis workbook as an appendix.

Slide	Content	Notes
1	Title + Executive Summary	3 bullet headlines the CMO will remember
2	Campaign Overview + Media Plan Summary	Budget split, channels, flight dates
3–4	Meta Ads Performance	CTR / CVR / ROAS vs benchmark + placement drill-down
5	Google Search Performance	Incl. keyword-group, city / device cut
6	YouTube Performance	Format drill-down, VTR story
7	Influencer Performance	Tier-level ROAS + top/bottom creators
8	Platform Sales Impact	Daily sales, AOV, new vs repeat customers
9	Channel-by-Channel Summary Scorecard	Single-view table — green / amber / red vs benchmark
10	Recommendations · Do Differently	Budget reallocation, channel retirement, creative
11	Recommendations · Keep the Same	What worked and should scale
12	Recommendations · Measurement Roadmap	Incrementality tests, UTM cleanup, etc.
13	Appendix	Methodology, assumptions, caveats

Evaluation Rubric

Dimension	Weight	What Excellence Looks Like
Data Handling	15%	Correctly cleans messy data. Documents every assumption. Reconciles spend to media plan.
Analytical Depth	25%	Goes beyond channel-level totals into keyword / placement / creator / city cuts. Spots the non-obvious patterns (e.g. micro-influencer ROAS, gift-set AOV effect).
Business Acumen	25%	Frames findings in business language. Understands funnel-stage nuance. Avoids the mistake of comparing upper-funnel channels to lower-funnel ones on CVR.
Insight Quality	20%	Every chart has a 'so-what' headline. Recommendations are specific, quantified and actionable, not vague ('spend more on what worked').
Storytelling & Design	15%	Deck reads as a narrative, not a data dump. Charts are clean, labeled, benchmark-referenced. Exec summary is true (would you read it first if time-starved?).

★ A parting note

Real analyst work is 30% data, 70% judgment. The analysts who win — at Deloitte, McKinsey, Uber, Amazon Ads, Swiggy, Meta, or the D2C brand that hires you next year — are not the ones with the deepest Excel tricks, but the ones who can **look at a number and know what it means for a human decision-maker**. Write every slide imagining a CMO staring at it in a 30-minute review with three other stakeholders. Would she nod and take an action? That's the bar. Good luck.

Data is synthetic but structurally modeled on real D2C beauty campaigns in India. This case study is for educational purposes only. Any resemblance to actual brands, creators, or campaigns is coincidental.
